Dear Colleague

PERINATAL & INFANT MORTALITY SURVEY 2008/9 – ARDEN

This report relates to the newly formed **Arden Cluster and its constituent PCTs**. It provides an update of mortality rates to 2009 for stillbirths and neonatal deaths, and to 2008 for infant deaths. PCT cohorts are defined here according to postcode.

Method

The regional information is based on the WM Perinatal Death Notifications (PDNs) which the Perinatal Institute receives from its network of co-ordinators in West Midlands units. The information may sometimes differ from the last ONS Vital Statistics, because our data includes late ascertained cases which are notified to the PI on an ongoing basis. We have also implemented cross checks with the WM Safeguarding Children's Boards.

This report includes

- birth rate trend in Arden, West Midlands (WM) and England & Wales (E&W);
- a short description of C & W demographics based on PEER 09/10;
- numbers, rates and 3year moving averages for
 - stillbirths (from 24 weeks)
 - early neonatal deaths (birth to age 7 days)
 - perinatal deaths (stillbirths and early neonatal deaths)
 - neonatal deaths (birth to age 28 days)
 - infant deaths (birth to 12 months)

Although these categories overlap, the data are presented for ease of reference and comparison with other reports. Unlike previous national reports, we continue presenting trends by 3 year moving averages, as year-on-year variation may often falsely identify outliers.

As in previous years, we also present 'corrected' rates, whereby we exclude congenital anomalies and pre-viable births, to allow more useful comparisons between PCTs with different populations.

For stillbirths and infant deaths, we have undertaken the following additional analyses:

1. mortality rates plotted against deprivation index of the birth population: this allows each PCTs mortality rate to be seen within the context of the level of deprivation within its population;
2. analysis of stillbirths and infant deaths within major classification groups, to assess the main contributing causes.

Findings

1. **Births**
 - a. As the graph shows, birth trends in Arden and WM follow the national trend. The number of births have been increasing in recent years, but appear to have reached a plateau in 2009.
 - b. In the table, several comparative maternity demographics are presented for Arden and the rest of WM. Mothers in Arden tend to be older, have less social deprivation, lower smoking rates and lower obesity rates than the rest of the region; their babies are also less likely to have intrauterine growth restriction or be born prematurely.
2. **Stillbirth trends**

Arden crude and corrected stillbirth rates are lower than the WM, and also lower than the national average, although the confidence intervals are wide and overlapping.
3. **Stillbirths and Deprivation:** This analysis, for crude and corrected figures, shows that PCT stillbirth rates are at the lower end or below the expected range, adjusted for each PCT's respective IMD score.
4. **Stillbirth classification groups:** trends are presented for the main groups but analysis is limited because of small numbers. Deaths associated with intrauterine growth restriction (IUGR) represent the largest category. Compared to the rest of the West Midlands, rates are lower in each of the main categories.
5. **Infant deaths – trends**
 - a. Arden infant death rates are similar to those in E&W and below those of WM. There is variation between Coventry and Warwickshire, however the differences are not statistically significant because of wide confidence intervals. Corrected rates (after exclusion of congenital anomalies and previable births) are also shown.
6. **Infant deaths and deprivation:** as for stillbirths, this analysis shows that the infant mortality rates for each of the PCT's, after adjustment for their respective IMD scores, are at the lower end or below the prediction line.
7. **Infant death classification groups** – as elsewhere, the largest categories are pulmonary immaturity and congenital anomalies. There was an apparent drop in deaths associated with pulmonary immaturity until 2008. In comparison with the rest of the West Midlands, there are fewer deaths in most main categories - with the exception of SUDI (sudden unexpected deaths in infancy), due to 8 cases reported in Coventry during the last triennium.

Sections 8 & 9 show rates for subgroups of infant deaths (**early neonatal and neonatal**). In Section 10, rates for **perinatal deaths** are presented, with similar comparisons for crude and corrected rates.

Further analyses are currently being undertaken and will be reported in the coming weeks, including a more thorough analysis of subgroups of the WM maternity population.

Comments and suggestions for our reports are always welcome, and specific analyses continue to be available on request (www.pi.nhs.uk/data).

With sincere regards

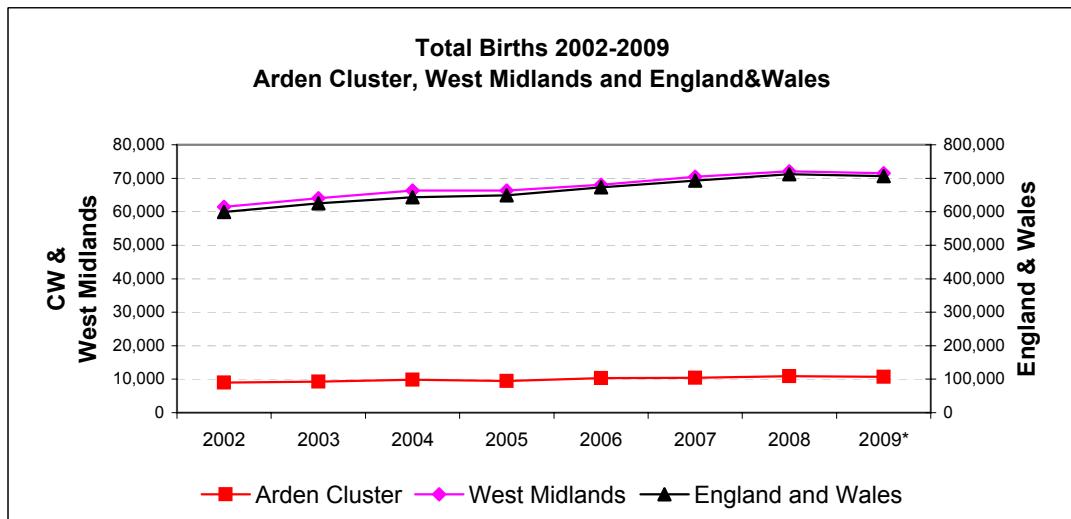

Professor Jason Gardosi
Director, West Midlands Perinatal Institute
