22 July 2010

Dear Colleague

PERINATAL & INFANT MORTALITY SURVEY 2008/9 – BIRMINGHAM

This report relates to the newly formed **Birmingham Cluster and its constituent PCTs**. It provides an update of mortality rates up to 2009 for stillbirths and neonatal deaths, and up to 2008 for infant deaths. PCT cohorts are defined here according to postcode.

Method

The regional information is based on the WM Perinatal Death Notifications (PDNs) which the Perinatal Institute receives from its network of co-ordinators in West Midlands units. The information may sometimes differ from the last ONS Vital Statistics because our data includes late ascertained cases which are notified to the PI on an ongoing basis. We have also implemented cross checks with the WM Safeguarding Children's Boards.

This report includes

- birth rate trend in Birmingham, West Midlands (WM) and England & Wales (E&W);
- a short description of Birmingham demographics based on PEER 09/10;
- numbers, rates and 3year moving averages for
 - stillbirths (from 24 weeks)
 - early neonatal deaths (birth to age 7 days)
 - perinatal deaths (stillbirths and early neonatal deaths)
 - neonatal deaths (birth to age 28 days)
 - infant deaths (birth to 12 months)

Although these categories overlap, the data are presented for ease of reference and comparison with other reports. Unlike previous national reports, we continue presenting trends by 3 year moving averages, as year on year variation may often falsely identify outliers.

As in previous years, we also present 'corrected' rates, whereby we exclude congenital anomalies and pre-viable births, to allow more useful comparisons between PCTs with widely different populations.

For stillbirths and infant deaths, we have undertaken the following additional analyses:

1. mortality rates plotted against deprivation index of the birth population: this allows each PCT's mortality rate to be seen within the context of the level of deprivation within its population;
2. analysis of stillbirths and infant deaths within major classification groups, to assess the main contributing causes.

Findings

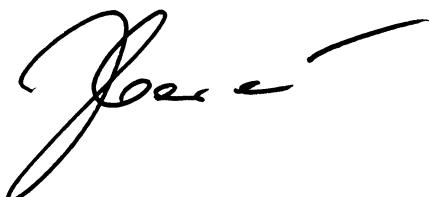

1. Births
 - A. As the graph shows, births in Birmingham and WM follow the national trend. The number of births have been increasing in recent years, but appear to have reached a plateau in 2009.
 - B. In the table, several comparative maternity demographics are presented for Birmingham and the rest of WM. The figures highlight the high rates of deprivation in Birmingham, and list the main groups according to ethnic origin, with British Europeans representing 43% of the maternity population, followed by South Asians (33%), including 23% Pakistani. Although the smoking rate is lower, prematurity and IUGR rates are similar to the rest of WM.
2. Stillbirths
 - a. Birmingham stillbirth rates continue to be higher than in E&W and WM, although appearing to fall gradually (trend $p=0.38$, NS).
 - b. Correction by exclusion of congenital anomalies shows that Birmingham rates are only marginally above the regional and national average, demonstrating the big impact which anomalies have on Birmingham mortality rates.
3. Stillbirths and Deprivation: This analysis is also repeated for crude and corrected figures, and shows that PCT rates are mostly within or even below the expected range when adjusted for IMD score.
4. Stillbirth classification: the largest category is intrauterine growth restriction (IUGR), with a suggested but non-significant downward trend. The relatively large group of 'unexplained / unclassified' cases is likely to be related to the low uptake of postmortems in this population.
5. Infant deaths
 - a. Birmingham infant death rates are higher than WM, which in turn are higher than E&W. There is substantial variation between PCTs, and an apparent increase in Solihull in 2008.
 - b. Corrected rates (after exclusion of congenital anomalies and preivable births) are much closer to the regional average (no national adjusted/corrected data available for infants).
6. Infant deaths and deprivation: the plot shows again the respective infant mortality rates when adjusted according to deprivation index. Neither of the Birmingham PCTs are outliers.
7. Infant mortality groups: trend analysis suggests gradual reduction of prematurity and preivable deaths, although again not reaching statistical significance. Compared to the rest of the West Midlands, Birmingham has significantly higher rates of infant deaths in each of the main categories.

Sections 8 & 9 show rates for subgroups of infant deaths (**early neonatal and neonatal**). In section 10, rates for **perinatal deaths** are presented, with similar comparisons for crude and corrected rates.

Further analyses are currently being undertaken and will be reported in the coming weeks, including a more thorough analysis of subgroups of the WM maternity population.

Comments and suggestions for our reports are always welcome, and specific analyses continue to be available on request (www.pi.nhs.uk/data).

With sincere regards

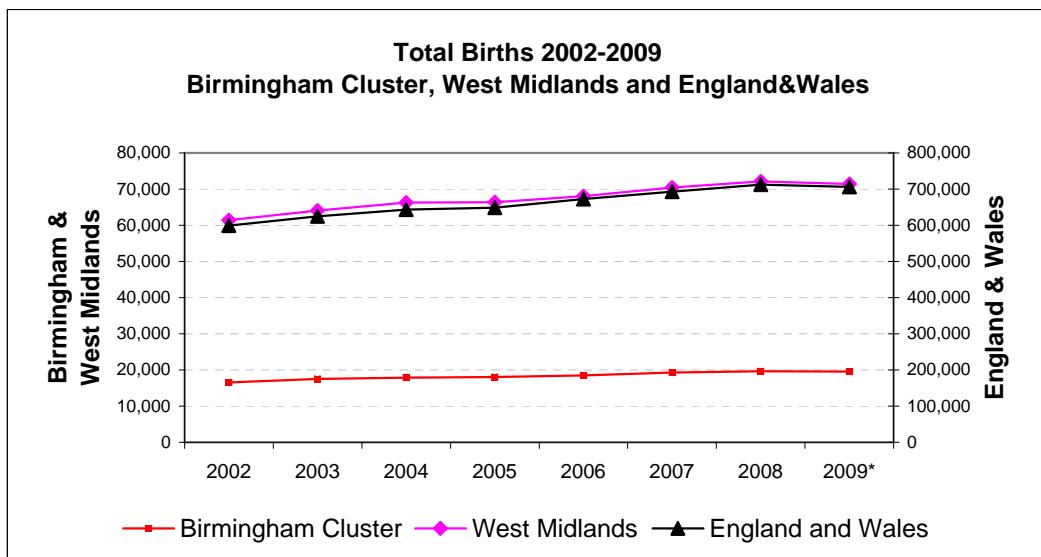

Professor Jason Gardosi
Director, West Midlands Perinatal Institute

6. Infant deaths and Deprivation, Birmingham PCTs

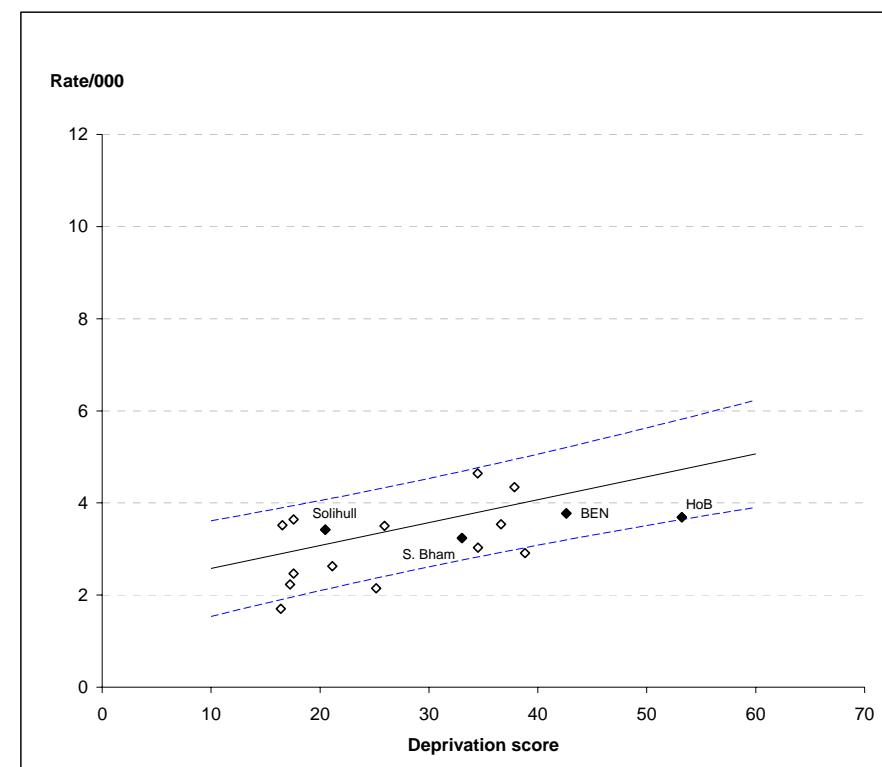

Graphs show infant deaths for the last available triennium (2006-8) for Birmingham PCTs, plotted against each PCT's respective deprivation score (IMD 2007).

Regression line with 90% prediction intervals (based on 2002-2008 data) are also shown

a. Crude rates

B. Corrected rates (after excluding major congenital anomalies and neonatal deaths <22 weeks and/or <500g)
