Dear Colleague

PERINATAL & INFANT MORTALITY SURVEY 2008/9 – BLACK COUNTRY

This report relates to the newly formed **Black Country Cluster and its constituent PCTs**.

It provides an update of mortality rates to 2009 for stillbirths and neonatal deaths, and to 2008 for infant deaths. PCT cohorts are defined here according to postcode.

Method

The regional information is based on the WM Perinatal Death Notifications (PDNs) which the Perinatal Institute receives from its network of co-ordinators in West Midlands units. The information may sometimes differ from the last ONS Vital Statistics, because our data includes late ascertained cases which are notified to the PI on an ongoing basis. We have also implemented cross checks with the WM Safeguarding Children's Boards.

This report includes

- birth rate trend in Black Country, West Midlands (WM) and England & Wales (E&W);
- a short description of Black Country demographics based on PEER 09/10;
- numbers, rates and 3year moving averages for
 - stillbirths (from 24 weeks)
 - early neonatal deaths (birth to age 7 days)
 - perinatal deaths (stillbirths and early neonatal deaths)
 - neonatal deaths (birth to age 28 days)
 - infant deaths (birth to 12 months)

Although these categories overlap, the data are presented for ease of reference and comparison with other reports. Unlike previous national reports, we continue presenting trends by 3 year moving averages, as year-on-year variation may often falsely identify outliers.

As in previous years, we also present 'corrected' rates, whereby we exclude congenital anomalies and pre-viable births, to allow more useful comparisons between PCTs with different populations.

For stillbirths and infant deaths, we have undertaken the following additional analyses:

1. mortality rates plotted against deprivation index of the birth population: this allows each PCTs mortality rate to be seen within the context of the level of deprivation within its population;
2. analysis of stillbirths and infant deaths within major classification groups, to assess the main contributing causes.

Findings

1. Births

- a. As the graph shows, birth trends in BC and WM follow the national trend. The number of births have been increasing in recent years, but appear to have reached a plateau in 2009.
- b. In the table, several comparative maternity demographics are presented for Black Country and the rest of WM. Mothers in BC have a higher rate of deprivation, obesity and teenage pregnancy; they are also more likely to smoke at booking, but have a higher cessation rate. Their babies have higher rates of IUGR (intrauterine growth restriction) and prematurity.

2. Stillbirth trends

- a. Black Country stillbirth rates are higher than those in E&W and, although running along the average WM rate, have recently increased above the regional average. This appears to be mainly due to higher rates in Wolverhampton and Sandwell, although the confidence intervals are wide and overlapping.
- b. After exclusion of congenital anomalies (2B), the elevated rate of stillbirths in Wolverhampton in 2009 are found to be significantly higher than the West Midlands average.

3. **Stillbirths and Deprivation:** This analysis, for crude and corrected figures, shows that stillbirth rates are mostly within the expected range adjusted for each PCT's IMD score, except for the corrected stillbirth rates in Wolverhampton.

4. **Stillbirth classification groups:** trends are presented for the main groups but analysis is limited because of small numbers. Deaths associated with intrauterine growth restriction (IUGR) represent the largest category, and are higher than in the rest of WM, as are deaths due to placenta/cord causes and intrapartum asphyxia.

5. Infant deaths – trends

Black Country infant death rates are also above those in E&W and WM. There is variation between PCTs, which mostly disappears when congenital anomalies and previable births are excluded.

6. **Infant deaths and deprivation:** this analysis shows that, for crude as well as corrected rates, after adjustment for the respective IMD scores the infant mortality rate of the four PCTs lies within the prediction line.

7. **Infant death classification groups** – as elsewhere, the largest categories are pulmonary immaturity and congenital anomalies, with the latter suggesting an increase in recent years. As the histogram shows, the higher infant mortality rate in BC vs WM comparison was reflected in most categories, the difference being most marked in deaths due to immaturity, infection and SUDI.

Sections 8 & 9 show rates for subgroups of infant deaths (**early neonatal and neonatal**). In section 10, rates for **perinatal deaths** are presented, with similar comparisons for crude and corrected rates.

Further analyses are currently being undertaken and will be reported in the coming weeks, including a more thorough analysis of subgroups of the WM maternity population.

Comments and suggestions for our reports are always welcome, and specific analyses continue to be available on request (www.pi.nhs.uk/data).

With sincere regards

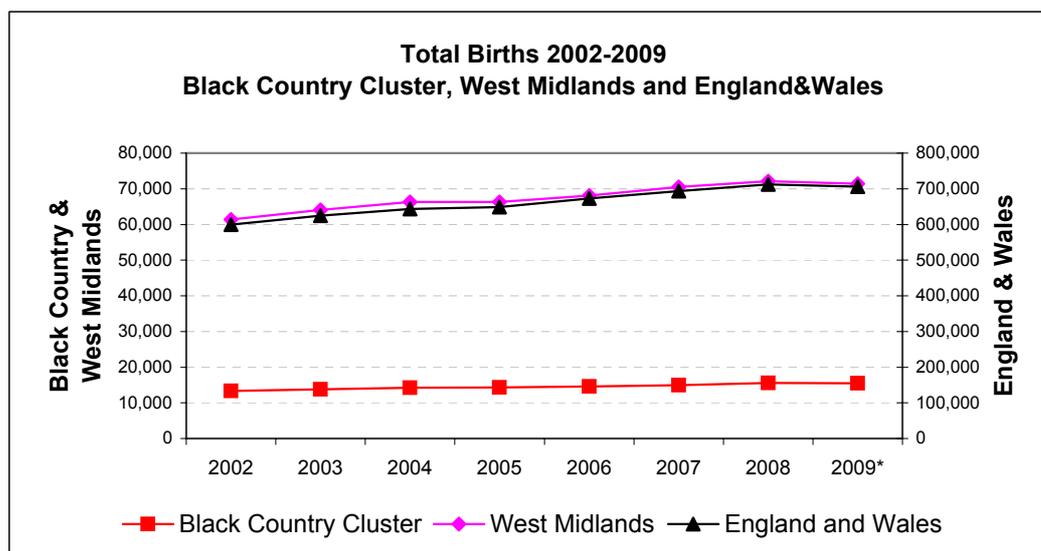

Professor Jason Gardosi
Director, West Midlands Perinatal Institute
